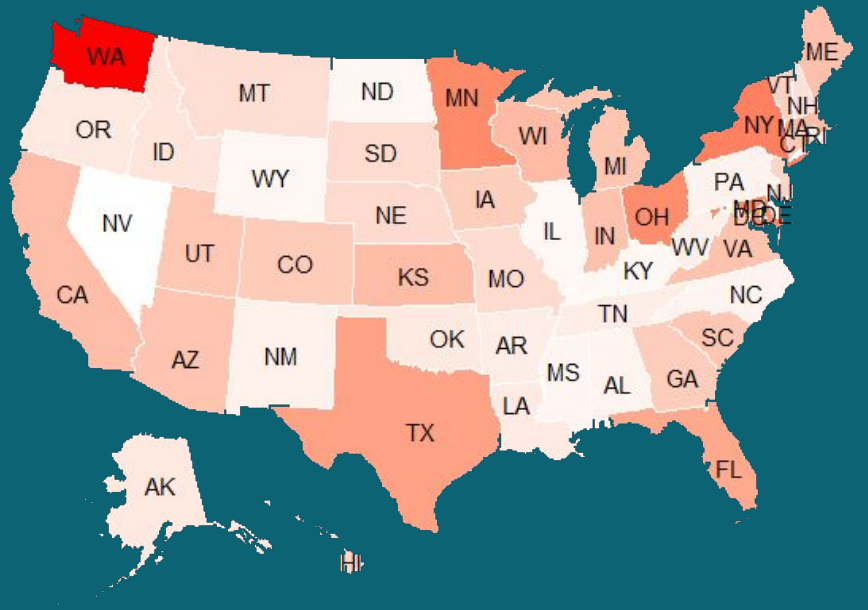
Data Mining
Final Project

Behavioral Risk Factor Surveillance System

Based on the variables related to mental illness, could we predict the state of the individuals ?

Possible mental illnesses:

- Had Depressive Disorder
- Mental Health Days
- Difficulty Concentrating
- Difficulty Errands
- Sleep Hours



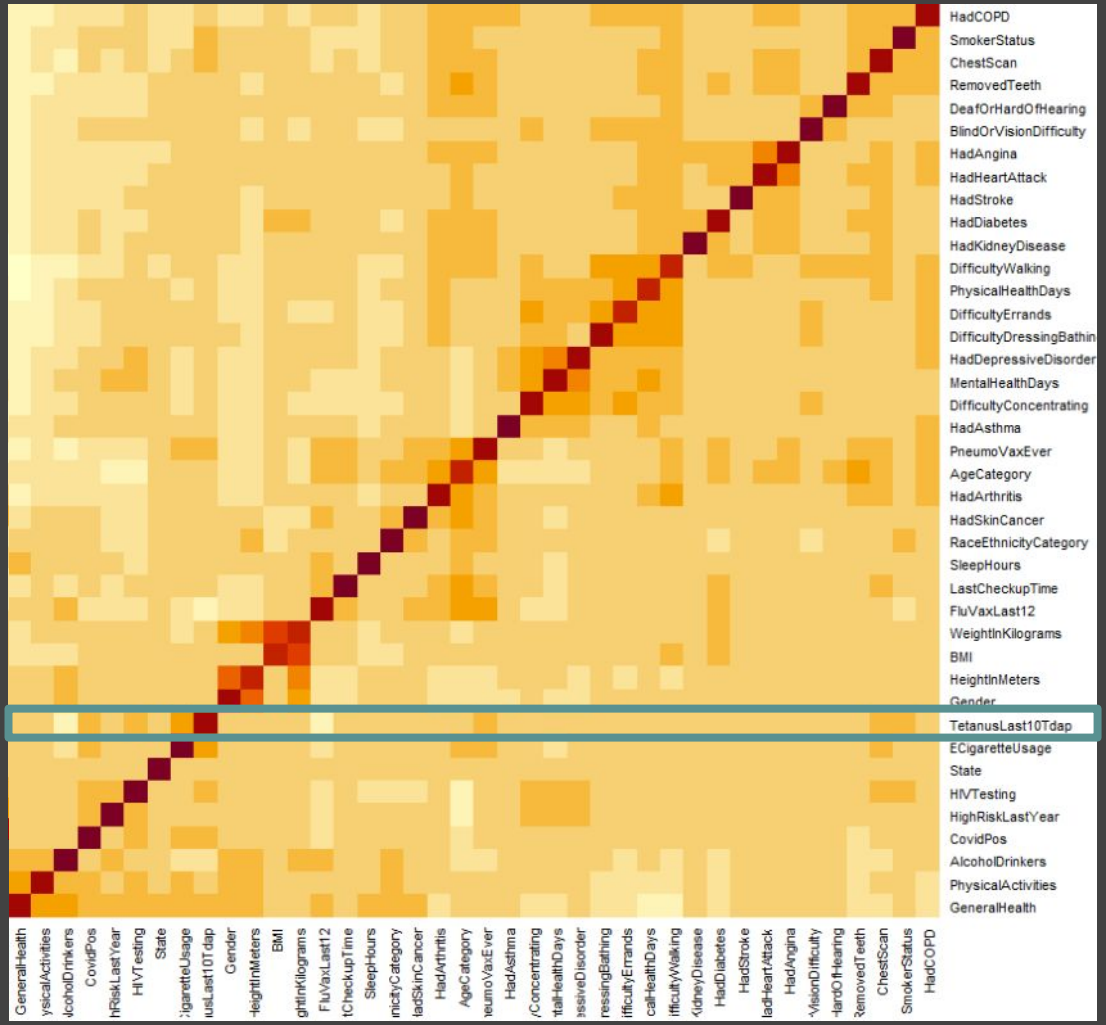
Which are the illness that affect more to healthier individuals ?

Can we predict the general status with the available data ?

How it’s going to react with our own data ?

Name	PysicalHealthDays	MentalHealthDays	LastTimeCheckup...
Josep	3	1	35
Martí	1	0	5
Macià	0	0	60
Pau	0	5	12
Sílvia	1	2	3

Can we classify other diseases that are related with tetanus ?



More related with:

- Covid
- HIV
- Smoker
- PneumoVax
- Chest scans

What are the characteristics of people that had covid ?

And the consequences ?
